

I have been working on everything from the data gathering in the backend and the database to front end in the settings page. I participated in creating the way to download and getting the data from calendar files to use to get the classes for the week. I jobbed at parsing the data then to get it usable for other tables in the database. I also worked at getting post functions to work since in the start we couldn't get it to work and, we were sending it with signal-r instead. I helped to debug the discord login since we couldn't find out where the request was sent in the start, and we wanted to sett the email as verified if they logged in with discord.

I was looking through new versions for bugs and helping to fix them. I found many related to the queue that I helped to fix. I made the backend for adding to read for classes in the settings page and help, making the front end for it to.
